

Vulcan Introduces New Photo Luminescent Signage

Vulcan Utility Signs, Foley, Alabama

August 30, 2010

Vulcan Utility Signs, a part of Vulcan, Inc., is leading the utility industry with the addition of Vulcan Ultra Glow, a new photo luminescent product that will enhance the possibilities of their current innovative product line. This signage substrate is proving to be a technological breakthrough in areas where public safety is a concern. In addition to typical exit signs, this product was introduced to the marketplace with limitless customizable applications, such as reflective patches on fire fighter helmets and non-slip step overlays for stadium stairways that illuminate individual steps in the dark.

Vulcan Utility Signs will be the first to market this product to the utility world. The glowing signage will bring resourceful solutions to the safety and compliance program that Vulcan Utility Signs promotes with their "Mark It To Protect It" awareness campaign. Custom utilization for this product is endless in the utility marking industry. In fact, Vulcan is still discovering and developing new applications for the signage, including a method for marking above and below water drilling platforms.

How It Works: The advanced photo luminescent technology enables signs to illuminate in dark or low-lit areas without the aid of any electricity or batteries. Vulcan Ultra Glow automatically charges when exposed to natural or artificial light and produces a luminescence which lasts for 18 hours or more when fully charged. As always, Vulcan has tested Vulcan Ultra Glow with the most rigorous testing processes in the industry to ensure the product will stand up to the quality standards that Vulcan customers have come to expect.
